

VCOM Circuit™ -- Salvage Yards

VCOM Circuit™ for salvage yards leverages the power of the internet to usher in the next generation of digital private circuits. Functionally, the system uses the internet to replace leased lines from the telephone company and a robust, all software summing/mixing engine to replace hardware based multiplexers. The result is better fidelity, a high quality of service, and the assurance that the circuit will be available well into the future.

Moreover, circuit operators now have the ability to easily identify foul play and unusual noises and disconnect individual users helping create a more pleasant and productive working environment.

Circuit Users need not work any differently. Users simply use the provided VCOM Circuit User Station, which facilitates push-to-talk operation, to communicate their requests over an open circuit using virtually any internet connection available.

VCOM Circuit User Stations include:

- PC complete with Windows® XP P4 processor
- VCOM Client software to stream phone feed into the virtual circuit
- Remote access software for easy technical support
- Push-to-talk phone and adapter cables to connect phone to PC

Actual VCOM User Station

With VCOM Circuit™, **Circuit Administrators** enjoy the same benefits as **Circuit Users** and also have the ability to conduct private communications with any user, all from any registered PC connected to the internet using the intuitive VCOM Control Panel.

Master VCOM Control Panel for Circuit Operator
